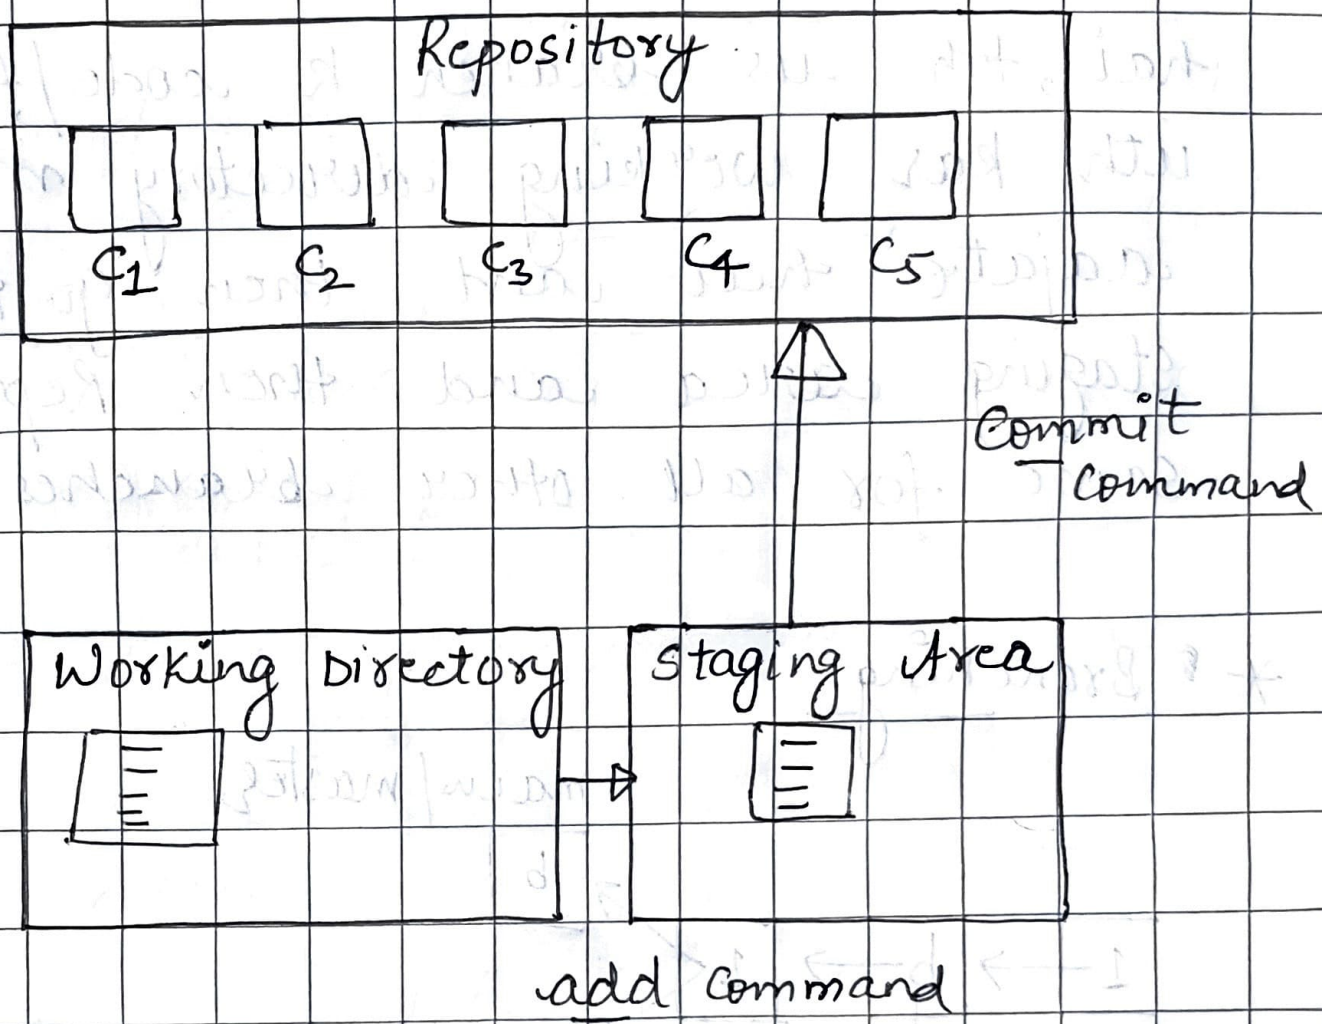
How Git takes a snapshot

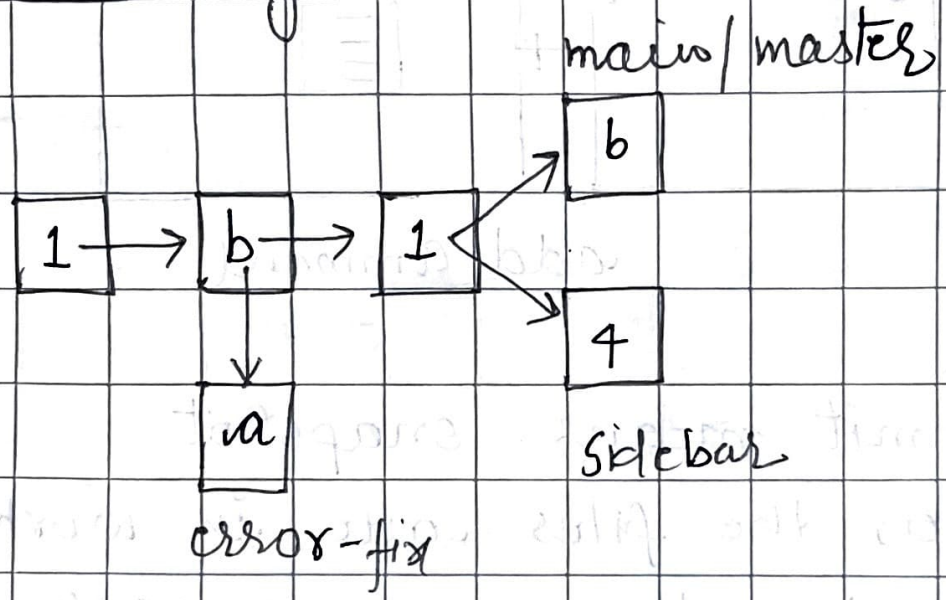
Date / /



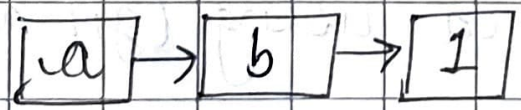
- Commit means snapshot
- When the files are in working directory they are untracked, To track them add these files to staging area using (git add .).

Jab bhi hum branch me switch karte hai, toh us branch k code/files uth kar working directory me aajate hai and then go through staging area and then Repo. same for all other branches.

* **Branching**



⇨ git log --oneline (when we are in error-fix branch)

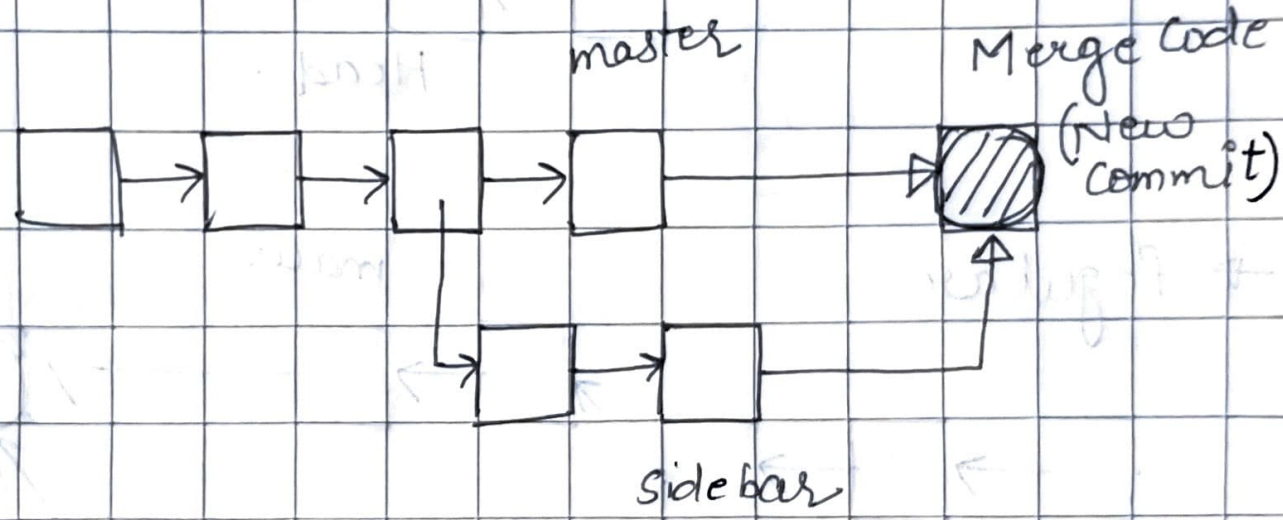


⇨ when we are in main branch

Date: / /

⇒ When we are in sidebar branch

** Branching **

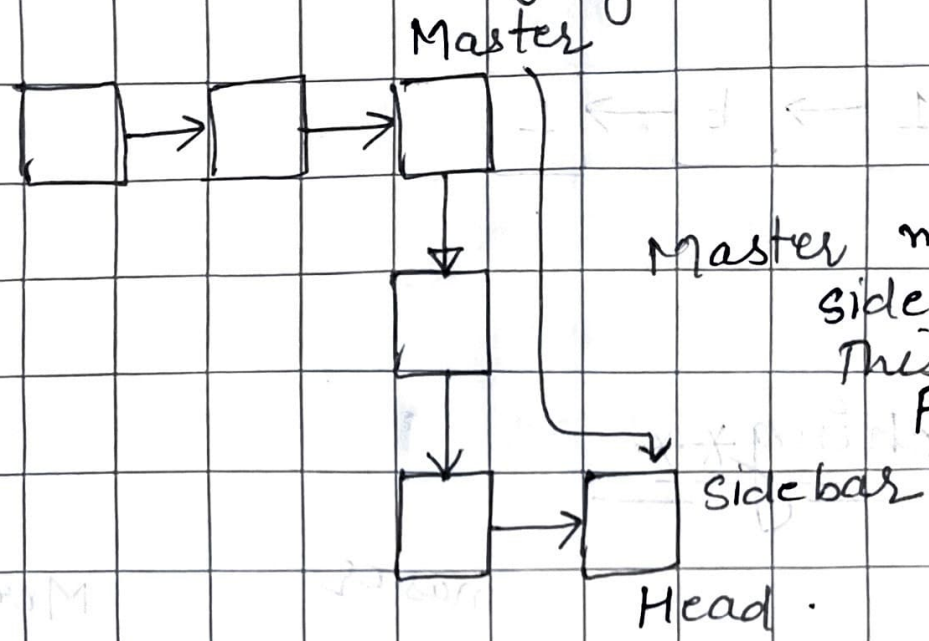


⇒ New commit is created on merging

Two types of Merging
- Fast Forward
- Regular (Divergent branches).

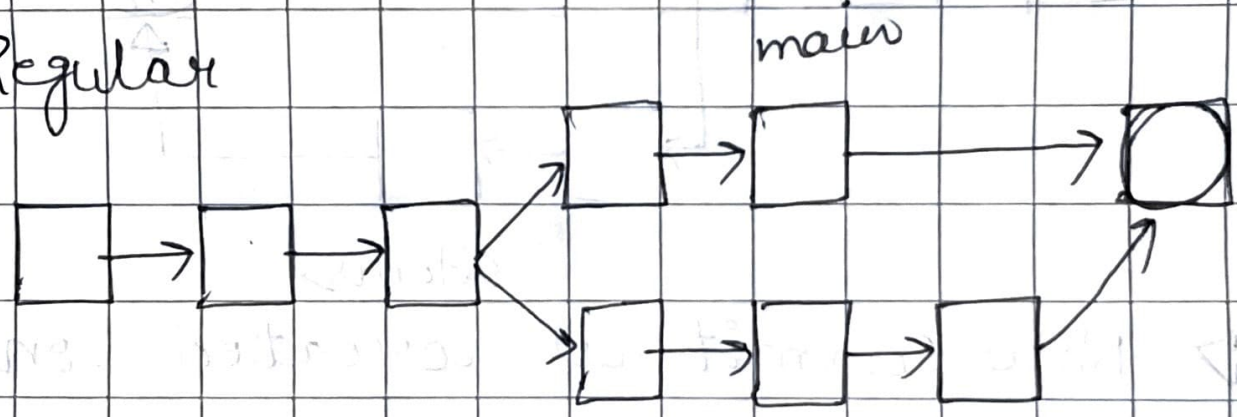
Date: / /

→ Fast Forward Merging



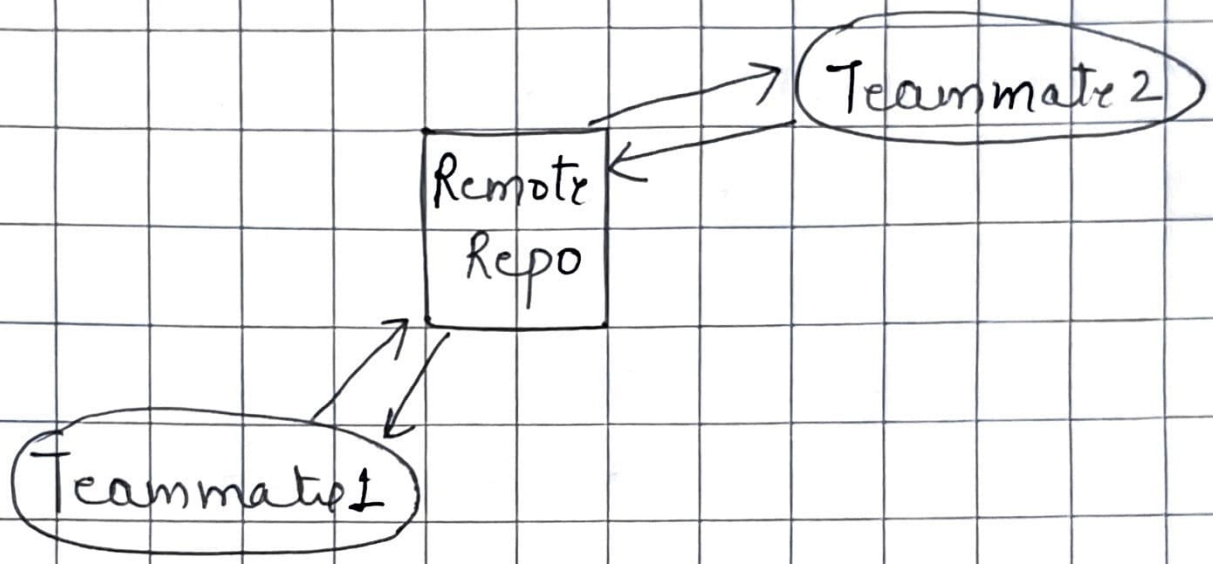
Master move to sidebar. This is Fast Forward.

→ Regular



This is called Regular or Divergent Branching

Concept of Remote Repository

Date: / /


➡ We create a repo over a server so that anyone can access it from anywhere
